

Enterprise-Grade KCC-20 Volume Trading Bot

Automated Market Liquidity & Volume Generation White Paper

Version 1.1 • September 2026 • Non-Custodial Automated Trading & Liquidity Infrastructure

1. Executive Summary

KasVolume is a specialized, automated volume-trading and market-liquidity bot engineered specifically for KCC-20 tokens within the Kaspa ecosystem. It empowers project founders, token creators, and market makers to maintain healthy market liquidity, consistent trading activity, and algorithmic price discovery without manual intervention.

KasVolume utilizes a standardized, highly optimized execution model designed to guarantee consistent order flow:

- **Fixed Trade Size:** Exactly **21 KAS** per buy and sell transaction.
- **Execution Cycle:** 5 consecutive buys followed by 5 consecutive sells.
- **Timing Interval:** Precisely **6 minutes** between each sequential trade execution.

Each project bot deployment is initiated via a one-time activation fee of exactly **100 KAS**, paid directly upon setup. Once launched, the trading bot operates continuously according to the deterministic cycle profile.

"KasVolume revenue = launched project bots × 100 KAS (one-time activation fee per project deployment)."

2. The Deterministic Volume Model

To eliminate ambiguity and ensure predictable liquidity generation, KasVolume operates on a structured, rhythmic engine:

CYCLE PHASE	ACTION TYPE	AMOUNT PER TRADE	TIME INTERVAL
Phase A (Buys)	5 Buys In	21 KAS	6 minutes apart
Phase B (Sells)	5 Sells Out	21 KAS	6 minutes apart

Why the 21 KAS / 6-Minute Model?

This rhythm prevents erratic order book distortion while maintaining a steady heartbeat of transactions every 6 minutes. The balanced 5-in / 5-out cycle with exact 21 KAS sizing establishes stable volume metrics visible on decentralized aggregators without inducing artificial downward or upward price drift.

3. Product Architecture & Deployment Workflow

KasVolume delivers a streamlined deployment workflow for token projects:

1. Project team connects their designated KasWare-compatible deployment wallet.
2. The user inputs the target KCC-20 token identifier to apply the standard volume model (21 KAS trades, 6-minute intervals).
3. The system initiates the one-time activation transaction of **100 KAS**.
4. Upon on-chain confirmation of the activation fee, the bot initializes its 5-buy / 5-sell cycle engine.
5. Autonomous volume generation commences securely under the preset deterministic parameters.

PROJECT LAUNCHES	FEE STRUCTURE	BILLING MODEL	TOTAL ACTIVATION REVENUE
1 Project Bot	100 KAS	One-time per launch	100 KAS
10 Project Bots	100 KAS	One-time per launch	1,000 KAS
50 Project Bots	100 KAS	One-time per launch	5,000 KAS
100 Project Bots	100 KAS	One-time per launch	10,000 KAS

* Protocol fee destination address:

`kaspa:qz6d1tvkds80wf8raac504ze4nesgnk72n24jr7krum2m8dq34khvkevr88cc`

4. Security & Non-Custodial Design

- **Non-Custodial Execution:** KasVolume never takes custody of primary token reserves or private keys; trading bots operate via dedicated sub-wallets funded by the project.

- **Deterministic Rhythms:** Fixed 21 KAS sizing and strict 6-minute spacing ensure predictable, audit-friendly automated operations.
- **Slippage & Drawdown Guardrails:** Automated circuit breakers pause trading if token price volatility exceeds preset thresholds.
- **Transparent Activation:** The single 100 KAS activation fee is verified on-chain instantly, with zero recurring subscription fees.

5. Revenue Model & Projections

KasVolume captures protocol revenue exclusively through the one-time 100 KAS project bot activation fee.

MONTHLY ACTIVE LAUNCHES	FEE PER LAUNCH	MONTHLY GROSS REVENUE (KAS)
10 Launches	100 KAS	1,000 KAS
25 Launches	100 KAS	2,500 KAS
50 Launches	100 KAS	5,000 KAS
100 Launches	100 KAS	10,000 KAS
250 Launches	100 KAS	25,000 KAS

6. Strategic Roadmap

Phase 1: Core KCC-20 volume bot engine with standard 21 KAS / 6-minute cycle and 100 KAS single-fee deployment.

Phase 2: Advanced gas optimization and multi-pool support.

Phase 3: Real-time volume analytics dashboard and Telegram/Discord webhook alerts.

Phase 4: Enterprise multi-token market-making suites and institutional API access.

Phase 5: Decentralized bot-operator staking and governance integration.

7. Conclusion

KasVolume eliminates the liquidity cold-start problem for KCC-20 tokens through a proven, deterministic model (21 KAS trades, 5-in / 5-out cycles, 6-minute spacing) backed by a simple one-time 100 KAS activation fee.
